

Realm.One

The Specification Document

January 4, 2020

1 Overview

Realm one is an MMO that will serve to be the boiler plate for Worlds, which is a distributed MMO. If you don't know what that means, please check the code repository for Worlds [here](#). The purpose of realm.one is to build a badass game that can demonstrate the power of distributed gaming on the Worlds platform, the vision is: anyone should be able to fork the realm.one repository and build their own game which can be integrated into a massive universe.

2 Gameplay

Realm.one will start off as a very simple game, I will outline an MVG (minimum viable game). Players should connect using the same rsa keys they use to validate their transactions on a blockchain, no passwords required. The MVG is:

- Player can walk around, throughout the map
- Players can gain experience from killing monsters and doing quests
- Players can obtain items
- Players can see and interact with other players

2.1 Storyline

Maybe?

3 Map

The game map is built from tiles, each tile has a "GID" and layer, a room is a ".tmx" file, which contains all the tile placements and tile properties.

3.1 Static Tiles - L1/L2

Static tiles are tiles which do not move or animate. There are situated on layers one and two of the ".tmx" file. These are typically "set and forget" they may have various parameters such as "collision" which prevents monsters and players from walking over them.

3.2 Movement Tiles - L3

Movement tiles are tiles that indicate a change of map, such as stairs or hole. They contain a parameter that links to the next ".tmx" map to move into.

3.3 Object Tiles - L4

Object tiles are tiles that may change, such as a door (which can open or close) they are situated on layer four of the ".tmx" file. They contain various parameters that may indicate their status.

3.4 Monsters

Each monster has it's own unique ron file, which is the name of the monster. These ron files contain various attributes to this monster, such as HP, strength, etc... Monster tiles are situated on layer 4.

3.5 Players

Player are special tiles that don't live on the tmx file.
